1. In Erikson's theory, which psycho-social crises preceed and succeed Autonomy v/s Shame :

(1) Basic trust v/s mistrust and Industry v/s Inferiority.

(2) Initiative v/s Guilt and Industry v/s Inferiority.

(3) Industry v/s Inferiority and Identity v/s Role confusion.

(4) Basic trust v/s mistrust and Initiative v/s Guilt.

2. Read each of the following statements – Assertion (A) and Reason (R); and indicate your answer using code given below :

Assertion (A) : Horner found high level of motive to avoid success or fear of success in females.

Reason (R) : As a result of success, the threat of social rejection and fear concerning perceived lack of feminity are aroused in women.

Code :

(1) Both (A) and (R) are true, and (R) is the correct explanation of (A).

(2) Both (A) and (R) are true, but (R) is not the correct explanation of (A).

(3) (A) is true, but (R) is false.

(4) (A) is false, but (R) is true.

3. Match List – I with List – II and select the correct answer by choosing from code given below :

Instructions for Questions 46 to 50.

Read the following paragraph and answer the five questions which follow :

A researcher in experimental psychology hypothesized that a particular 'Reward System' for fast reactions would improve the reaction time. To verify this hypothesis, he selected forty subjects in the age range of 25 to 35 years from an organization. Following the standard reaction time experiment, he measured the simple reaction time without the reward system. While taking each trial in the experiment, the time-interval between the ready signal and the onset of stimulus was randomly varied between two to five seconds. In the second part of the experiment, the reward system was introduced and the simple reaction time was measured again for the same subjects. The mean reaction time before the introduction of reward system was 210 milliseconds and the mean reaction time after the introduction of reward system was 250 milliseconds. The difference between the two means was statistically significant at .01 level.

46. In the above study, the researcher's hypothesis is :

(1) Correlational hypothesis

(1) Mathematical and Verbal skills.
(2) Mental and Personal profile.
(3) Extent of temperamental adaptability.
(4) Analytical and Verbal Skills.

91. 'Mechanistic Behaviour Analyses' are characterised as :

(a) Behaviour is instigated by the onset of external or internal stimuli.
(b) Direction of behaviour is determined by S-R bonds or habits.
(c) Behaviour directed toward the goal persists till the achievement of goal.
(d) Events related to the goal achievement are encoded, categorised, and transformed into a belief.

Code :
(1) (a) and (b) correct ; (c) and (d) are incorrect.
(2) (b) and (c) correct ; (a) and (d) are incorrect.
(3) (a), (b) and (c) are correct ; (d) is incorrect.
(4) (b), (c) and (d) are correct ; (a) is incorrect.

92. Guilford (1981) in his modified SOI model mentioned hierarchical structure of intellectual abilities reporting that there are _____ first order factors ; _____ second order factors; and _____ third order factors.

(1) 150 ; 85 ; 20
(2) 120 ; 80 ; 20
(3) 150 ; 85 ; 16
(4) 180 ; 75 ; 18

93. Read each of the following statements – Assertion (A) and Reason (R); and indicate your answer using code given below :

Assertion (A) : Children have remarkable ability to create mental representation of the world in the form of language.

Reason (R) : Reasoning and problem solving are the ways of manipulating the ideas.

Code :

(1) Both (A) and (R) are true, and (R) is the correct explanation of (A).

(2) Both (A) and (R) are true, but (R) is not the correct explanation of (A).

(3) (A) is true, but (R) is false.

(4) (A) is false, but (R) is true.

94. Read each of the following statements – Assertion (A) and Reason (R); and indicate your answer using code given below :

Assertion (A) : Forgetting of everyday events in young people is not an indication of a poor memory.

Reason (R) : Ineffective encoding due to failure to attend to an event while it is happening results in failure to remember.

Code :

(1) Both (A) and (R) are true, and (R) is the correct explanation of (A).

(2) Both (A) and (R) are true, but (R) is not the correct explanation of (A).

(3) (A) is true, but (R) is false.

Instructions for questions 96 to 100 :

Read the following paragraph and answer the five questions which follow :

An educational psychologist wanted to develop an achievement test in physics for graduate students. After going through the usual test construction procedure, he retained 100 items; each item having five alternatives, one of them being correct. The psychologist wanted to examine the factor structure of the resulting achievement test. Using a sample of 1,000 subjects, the psychologist obtained the inter-item correlations. He obtained the initial estimates of communality and then decided to factor analyze the inter-item correlations matrix by following the common-factor model. He extracted the unrotated factors and retained the first nine factors for rotaion. The nine unrotated factors explained 67.5 percent of variance. After factor rotation, all the inter-factor correlations were found to be zero. The factor structure of the achievement test of physics was found to be interpretable.

96. The inter-item correlations would be :

(1) Biserial correlations
(2) Kendall's tau
(3) Phi-coefficients
(4) Point-biserial correlations

Aifer

97. Read each of the following statements – Assertion (A) and Reason (R); and indicate your answer using code given below :

Assertion (A) : For the factor analysis of item scores, Common-Factor model is quite often more suitable.

Reason (R) : Item scores are quite often less reliable than the psychometrically measured trait variables.

Code :

(1) Both (A) and (R) are true, and (R) is the correct explanation of (A).
(2) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
(3) (A) is true, but (R) is false.
(4) (A) is false, but (R) is true.

98. Which one of the following method of factor extraction, the psychologist would NOT use in the present study ?

(1) Principal axes method
(2) Principal components method
(3) Psychometric (alpha) factor analysis
(4) Maximum likelihood method

99. Which method/s of rotation has/have most probably been used in the present study ?

(a) Oblimin
(b) Promax
(c) Quartimax
(d) Varimax

Code :
(1) (a) only
(2) (c) only
(3) (c) and (d) only
(4) (b), (c) and (d) only

100. The second-order factor analysis of the nine rotated factors is not recommended in the present study because :

(1) There are only nine first-order factors.
(2) The interfactor correlations are zero.
(3) The factors obtained by common-factor model are not subjected to second-order factor analysis.
(4) Unrotated factors are more suitable for second-order factor analysis.
