Read the following paragraph and answer the five questions which follow

A psychologist wanted to develop an achievement test in Chemistry for SSC students of central schools For this purpose, he wrote 110 items having multiple-choice format He administered this draft version to a sample of 300 subjects. Item analysis was carried out by computing item-remainder correlations. The item analysis retained 80 items .The eighty-item version was administered to a fresh sample of 400 subjects which yielded a mean of 40.00 and standard deflation of 8.00. The scores were found to be normally distributed. Cronbach alpha for eighty-item version was found to be 0.94. The psychologist also computed odd-even reliability and Kuder - Richardson (K-R) reliability. For this version. On this version, one of the subjects Manas, had a score of 32 Since the eight. -item version was

considered long for administration, two forms. Form A and Form B were prepared by randomly assigning 40 items to each form.

91. The expected Cron bach alpha for Form A would be

1. 047
2. 089
3. 062
4. 0.94

92. In the above study, the psychologist computed three reliability coefficients

(b) Split-half reliability coefficient

(c) Kuder-richardson (K-12) reliability coefficient

3. (b) and (c) would be the same but (a) would be different
4. (a), (b) and (c),all thee would be different

93. For computing item-remainder correlations, which one of the following correlations would be suitable'

1. Phi-coefficient
2. Contingency coefficient
3. Point- biserial correlation
4. Tetrachoric correlation

94. The score of 32 (score obtained by Mamas on eighty-item version) would correspond to percentile rank

1. 16
2. 32
3. 80
4. 84

95. The 95%confidence interval for the true scat of $2 would be

4. 32±3.84

Read the following passage and answer the questions that follow

A researcher wanted to study the effect of organization of material (A) on recall. She expected that retention interval (B) would moderate the effect of organization of material. She varied A at three levels—Low organization. Moderate organization, and High organization. She varied B at two levels—Short retention interval and Long retention interval. The subjects were randomly assigned to the different groups. Each subject received the List of words with specified level of organization. Each of them learnt the list up to one errorless trial and was tested after the specified retention interval. All the subjects had also received the intelligence test .The number of items, recalled by the subject was the dependent variable. The data were analysed by the appropriate ANOVA,treating intelligence as a covariate. The partial results are given here—

(i) the sum of squares for organization of material (A) was 255.00
(ii) the degrees of freedom for error variance was 115
(iii) the F ratio for interaction (AxB) was 0.95

The obtained results were appropriately interpreted

96. The design in the above study can be best labelled as

1. randomized single-factor six-group design with a covariate
2. randomized balanced 3x2 factorial design with a covariate
3. randomized unbalanced 3x2 factorial design with a covariate
4. randomized 3x2 blocked factorial design with a covariate

97. The 'mean square for organization of material would be

1. 42.50
2. 127.50
3. 85.00
4. 255.00

98. From the above results, it can be concluded that

1.Main effect of organization of material is significant
2.Main effect of organization of material is non-significant
3.Retention interval does not moderate the effect of organization of material
4.Retention interval moderates the effect of organization of material
