Instructions for questions 46 to 50.

Read the following paragraph and answer the five questions which follow :

A psychologist, working in the area of Learning and Memory hypothesized that a particular drug would adversely affect the learning rate. One hundred and fifty subjects, 75 boys and 75 girls, studying in the first year of a degree college, in the age range of 18 to 20 years, were available for the study. It was ensured that all the subjects were in the DIQ (deviation IQ) range of 85 to 115. Three groups - A, B and C - of equal size were formed by random assignment. Group A received high dosage of drug, Group B received moderate dosage of drug, and Group C received only placebo. A list of 15 CVC trigrams, each having an association value in the range of 50 to 70 was already prepared. Each subject was required to learn the list upto two errorless trials using method of anticipation on a memory drum. The mean trials required to learn the list were 12, 15 and 20 respectively. The intergroup mean differences were statistically significant at .01 level.

46. Which one of the following conclusions can be drawn on the basis of the above study ?
